THE PLAN, IN FOUR NUMBERS

The Simple Version

BALANCE	RISK PER TRADE	TRADES PER WEEK	REWARD
$2,000,000	1% = $20,000	5 - one each	1:3 to 1:5

HOW TO READ EVERY NUMBER IN THIS DOCUMENT

1R = $20,000. That is what you lose if a stop is hit, and it is the same on all five assets. A 1:3 winner pays 3R = $60,000. A 1:5 winner pays 5R = $100,000. Gold, oil, silver, bitcoin and the Dow - one trade each, once a week.

Week A - two stopped out, three winners

ASSET	RESULT	R MULTIPLE	PROFIT / LOSS
XAUUSD	Stopped out	**-1R**	**-$20,000**
WTIUSD	Stopped out	**-1R**	**-$20,000**
XAGUSD	Target hit 1:3	**+3R**	**+$60,000**
BTCUSD	Target hit 1:3	**+3R**	**+$60,000**
DJIUSD	Target hit 1:5	**+5R**	**+$100,000**
TOTAL	**5 trades**	**+9R**	**+$180,000**

WEEK A PROFIT

+$180,000

+9R on the week, or +9% of the balance. Two losses cost $40,000 between them; the three winners brought back $220,000.

IF THE THIRD WINNER ALSO RUNS TO 1:5

Two of the three winners were named as 1:3 and 1:5, so the third is taken as a 1:3 here. If it reaches 1:5 instead, the week is **+11R = +$220,000** rather than +9R.

SCENARIO TWO

Week B - stops moved to entry

Same five trades, same $20,000 of risk on each. This time every position is moved to break-even once it goes your way, so four trades scratch out at entry for nothing instead of losing, and one runs all the way to 1:5.

ASSET	RESULT	R MULTIPLE	PROFIT / LOSS
XAUUSD	Stop moved to entry - scratched	**+0R**	**$0**
WTIUSD	Stop moved to entry - scratched	**+0R**	**$0**
XAGUSD	Stop moved to entry - scratched	**+0R**	**$0**
BTCUSD	Stop moved to entry - scratched	**+0R**	**$0**
DJIUSD	Target hit 1:5	**+5R**	**+$100,000**
TOTAL	**5 trades**	**+5R**	**+$100,000**

WEEK B PROFIT

+$100,000

+5R on the week, or +5% of the balance - from a single winning trade out of five.

What moving the stop to entry is worth

MANAGEMENT	OUTCOME	R	RESULT
Stops left where they were	4 losses and 1 winner at 1:5	**+1R**	**+$20,000**
Stops moved to entry	4 scratches and 1 winner at 1:5	**+5R**	**+$100,000**
Difference	**Same trades, same entries**	**+4R**	**+$80,000**

THE POINT OF WEEK B

Nothing about the trades changed - same entries, same stops, same targets. Only the management changed, and the week went from $20,000 to $100,000. The cost is that a trade which dips back to entry before running is now closed for nothing instead of eventually winning, so a real week lands somewhere between the two rows.

FOUR WEEKS

The Monthly Total

SCENARIO	PER WEEK	PER WEEK ($)	PER MONTH	MONTH, FIXED SIZE	MONTH, COMPOUNDED
Week A repeated	+9R	+$180,000	+36R	**+$720,000**	**+$823,163**
Week B repeated	+5R	+$100,000	+20R	**+$400,000**	**+$431,013**

Fixed size keeps 1R at $20,000 all month. **Compounded** recalculates 1% from the new balance each week, so the winners get bigger as the account grows. Four trading weeks to a month.

WEEK A - ONE MONTH

+$720,000

Fixed sizing. Compounded weekly it is **+$823,163**, taking the balance to $2,823,163.

WEEK B - ONE MONTH

+$400,000

Fixed sizing. Compounded weekly it is **+$431,013**, taking the balance to $2,431,013.

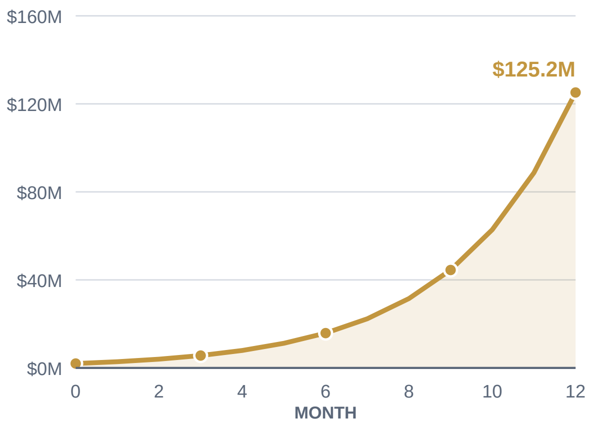
Twelve months, compounded

	WEEK A - BALANCE	GAIN	WEEK B - BALANCE	GAIN
Start	$2,000,000	-	$2,000,000	-
Month 1	$2,823,163	+$823,163	$2,431,013	+$431,013
Month 2	$3,985,125	+$1,985,125	$2,954,911	+$954,911
Month 3	$5,625,330	+$3,625,330	$3,591,713	+$1,591,713
Month 6	$15,822,166	+$13,822,166	$6,450,200	+$4,450,200
Month 9	$44,502,450	+$42,502,450	$11,583,632	+$9,583,632
Month 12	$125,170,474	+$123,170,474	$20,802,539	+$18,802,539

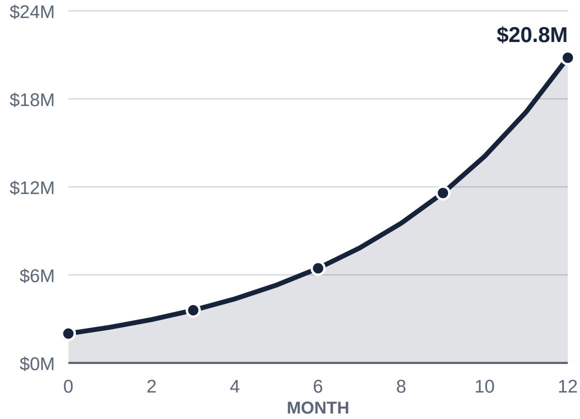
COMPOUNDED WEEKLY

Growth Over Twelve Months

WEEK A REPEATED - +9% a week



WEEK B REPEATED - +5% a week



Note the two vertical scales differ - Week A ends at $125,170,474, Week B at $20,802,539. Both curves are the same shape because both are the same arithmetic: a fixed weekly percentage, compounded.

The weeks that are not Week A

WEEK	R	PROFIT / LOSS	% OF BALANCE
All five stopped out	**-5R**	**-$100,000**	-5.0%
Four stopped out, one winner at 1:3	**-1R**	**-$20,000**	-1.0%
Three stopped out, two winners at 1:3	**+3R**	**+$60,000**	+3.0%
Week A	**+9R**	**+$180,000**	+9.0%

The same 1% risk that makes Week A worth $180,000 makes the worst possible week cost $100,000. Five losses in a row is a 5% drawdown - unpleasant, survivable, and the reason the risk is 1% and not 5%.

READ THIS BEFORE YOU TRUST THE CHART

Every figure here is correct arithmetic and none of it is a forecast. The charts assume the same week repeats fifty-two times without a single losing one - no month where three assets chop sideways, no gap through a stop, no drawdown. **A 9% week is a very good week, not an average one.** Real results also lose spread, commission and financing on every trade. Treat these numbers as what the sequence is worth if it happens, not as what a year looks like.

EVERY TRADE

$20,000

Risk $20,000. Aim for $60,000 to $100,000. Take five a week, one on each asset. Move the stop to entry once it is going your way. That is the entire system.
